

V-INI Editor

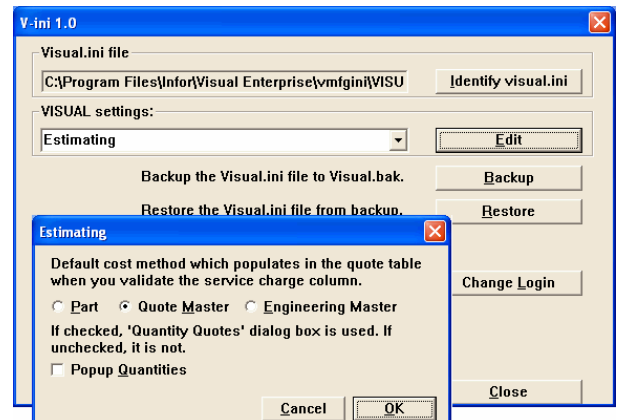

Version 1.0

\$95 (USD)*

VISUAL is a highly configurable system with hundreds of behind-the-scenes settings that control the way windows look, behave, and process your business information. Most of these settings are controlled by a file called visual.ini. Since some settings can be global and others are for specific users, this file resides both on the server and on each workstation. Making sure that each file is properly configured is critical to a stable installation. Moreover, a lack of knowledge of these settings can prevent desirable features from being used by your company. These files can be manually edited, however the spelling, syntax, and formatting must be exact for the file to be read successfully by the various VISUAL applications. V-INI Editor is a simple utility that allows systems people to alter the visual.ini file in a graphical way by using configuration wizards.

Benefits

- Avoid frustration with errors in capitalization, spacing, spelling, etc.
- Easy to browse through each configuration wizard to see which features may be desirable for your company
- No need to reference outside material to figure out common settings

Features

- Graphical user interface
- Most common settings are automated with wizards
- Settings are explained in plain English

Limitations

Not every setting can be edited with the V-INI Editor. Many control objects such as display persistence, which is maintained within VISUAL itself. These settings are best not edited in this manner.
